commonChannel

1. Run install-fabric.sh inside project folder: Give access : chmod +x ./install-fabric.sh
Run: ./install-fabric.sh
2. Inside cd fabric-samples/test-network . Run **./network.sh up createChannel -c mychannel -ca -s couchdb** to bring up network.(By default 2 org will get joined)
3. To join org3 - go inside cd addOrg3 and run **./addOrg3.sh up -ca -s couchdb**
4. Adding Org4:

Step 1: Copy Org3 Folder to Org4 (From inside: fabric-samples/test-network)

sudo chmod -R +r addOrg3
cp -r addOrg3 addOrg4

Step 2: Rename Crypto Configuration File

Inside add0rg4: mv org3-crypto.yaml org4-crypto.yaml

Then update contents:

sed -i 's/Org3/Org4/g' org4-crypto.yaml
sed -i 's/org3/org4/g' org4-crypto.yaml

Step 3: Update addOrg4 Script

Modify all references inside script:

sed -i 's/Org3/Org4/g' addOrg4/addOrg4.sh
sed -i 's/org3/org4/g' addOrg4/addOrg4.sh
sed -i 's/ORG3/ORG4/g' addOrg4/addOrg4.sh
Or
sed -i 's/Org3/Org4/g' addOrg4.sh
sed -i 's/org3/org4/g' addOrg4.sh
sed -i 's/ORG3/ORG4/g' addOrg4.sh

Verify:

grep -n "Org3" addOrg4/addOrg4.sh
grep -i org3 addOrg4.sh

(No output = correct)

Step 4: Rename Compose Files

Inside: addOrg4/compose

Rename:

mv compose-org3.yaml compose-org4.yaml

mv compose-ca-org3.yaml compose-ca-org4.yaml

mv compose-couch-org3.yaml compose-couch-org4.yaml

Then update contents:

sed -i 's/org3/org4/g' addOrg4/compose/*.yaml

sed -i 's/Org3/Org4/g' addOrg4/compose/*.yaml

sed -i 's/ORG3/ORG4/g' addOrg4/compose/*.yaml

Or
sed -i 's/org3/org4/g' *.yaml

sed -i 's/Org3/Org4/g' *.yaml

sed -i 's/ORG3/ORG4/g' *.yaml

Step 5: Rename Docker Compose Files

Inside: addOrg4/compose/docker

Rename:

mv docker-compose-ca-org3.yaml docker-compose-ca-org4.yaml

mv docker-compose-couch-org3.yaml docker-compose-couch-org4.yaml

mv docker-compose-org3.yaml docker-compose-org4.yaml

Then update contents:

sed -i 's/org3/org4/g' addOrg4/compose/docker/*.yaml

sed -i 's/Org3/Org4/g' addOrg4/compose/docker/*.yaml

sed -i 's/ORG3/ORG4/g' addOrg4/compose/docker/*.yaml

Step 6: Update Script References in org4-scripts

Copy org3-scripts:

cp -r scripts/org3-scripts scripts/org4-scripts
Or
cp -r org3-scripts org4-scripts

Then update:

sed -i 's/Org3/Org4/g' scripts/org4-scripts/*.sh

sed -i 's/org3/org4/g' scripts/org4-scripts/*.sh

sed -i 's/ORG3/ORG4/g' scripts/org4-scripts/*.sh
Or
sed -i 's/Org3/Org4/g' org4-scripts/*.sh

sed -i 's/org3/org4/g' org4-scripts/*.sh

sed -i 's/ORG3/ORG4/g' org4-scripts/*.sh

Step 7: Update Ports to Avoid Conflict

From inside: fabric-samples/test-network

We modified the ports inside Org4 compose files using:

sed -i 's/11051/12051/g' addOrg4/compose/*.yaml

sed -i 's/11052/12052/g' addOrg4/compose/*.yaml

sed -i 's/11053/12053/g' addOrg4/compose/*.yaml

sed -i 's/11054/12054/g' addOrg4/compose/*.yaml

And for Docker compose files:

sed -i 's/11051/12051/g' addOrg4/compose/docker/*.yaml

sed -i 's/11052/12052/g' addOrg4/compose/docker/*.yaml

sed -i 's/11053/12053/g' addOrg4/compose/docker/*.yaml

sed -i 's/11054/12054/g' addOrg4/compose/docker/*.yaml

Step 8: Set Execution Permissions

chmod -R +x addOrg4

chmod -R +x scripts/org4-scripts

Step 9: Add Inside envVar.sh

Open: fabric-samples/test-network/scripts/envVar.sh

a. Add Org4 block inside `setGlobals()`

Find where Org3 section ends.

```
elif [ $USING_ORG -eq 4 ]; then

  export CORE_PEER_LOCALMSPID=Org4MSP

  export CORE_PEER_TLS_ROOTCERT_FILE=$PEER0_ORG4_CA

  export
CORE_PEER_MSPCONFIGPATH=${TEST_NETWORK_HOME}/organizations/peerOrganizations/org4.example.com/users/Admin@org4.example.com/msp

  export CORE_PEER_ADDRESS=localhost:12051
```

b. Add CA variable at top:

Below export peer0_org3_ca=.....

```
export
PEER0_ORG4_CA=${TEST_NETWORK_HOME}/organizations/peerOrganizations/org4.example.com/tlsca/tlsca.org4.example.com-cert.pem
```

Step 10: Add Inside setAnchorPeer.sh

Open: fabric-samples/test-network/scripts/setAnchorPeer.sh

After elif [$ORG -eq 3]

add:

```
 elif [ $ORG -eq 4 ]; then

    HOST="peer0.org4.example.com"

    PORT=12051
```

Step 11: Add Inside joinChannel.sh

Open: fabric-samples/test-network/scripts/org4-scripts/joinChannel.sh

After copied addOrg3 → addOrg4
Need to change 3 → 4

setGlobals 4

infoln "Joining org4 peer to the channel..."

joinChannel 4

infoln "Setting anchor peer for org4..."

setAnchorPeer 4

Step 12: From Inside addOrg4 run: ./addOrg4.sh up -ca -s couchdb

Expected Output: Anchor peer set for org 'Org4MSP' on channel 'mychannel'

Channel 'mychannel' joined
Org4 peer successfully added to network

parulwanode@LAPTOP-H2LVHVAR:~/blockchain1/fabric-samples/test-network/addOrg4$

Docker output:

parulwanode@LAPTOP-H2LVHVAR:~/blockchain1/fabric-samples/test-network/addOrg4$
docker ps

parulwanode@LAPTOP-H2LVHVAR:~/blockchain1/fabric-samples/test-network/addOrg4$

To bring Network down:

STEP 1 — Go To test-network

cd ~/blockchain1/fabric-samples/test-network

STEP 2 — Bring Network Down Properly

./network.sh down

STEP 3 — Remove ALL Docker Containers (Force Clean)

docker rm -f $(docker ps -aq)

STEP 4 — Remove Docker Volumes

docker volume prune -f

Check: docker volume ls

Remove : docker volume rm compose_peer0.org4.example.com

Chaincode Deployment:

1. Inside test-network/scripts.deployCC.sh
For all 4 org update the file (From line 76)

Install chaincode on peer0.org1, peer0.org2, peer0.org3, peer0.org4

infoln "Installing chaincode on peer0.org1..."

installChaincode 1

infoln "Installing chaincode on peer0.org2..."

installChaincode 2

infoln "Installing chaincode on peer0.org3..."

installChaincode 3

infoln "Installing chaincode on peer0.org4..."

installChaincode 4

resolveSequence

fi

exit 0
```

Step 1: Create folder

Inside fabric-samples/:

```
mkdir crowdfund-chaincode
cd crowdfund-chaincode
```

Step 2: Create files

Put your Go file as:

[chaincode.go]

Step 3: Initialize Go module

go mod init crowdfund-chaincode

go get github.com/hyperledger/fabric-contract-api-go/contractapi

go mod tidy

Step 4: Deploy on test network

./network.sh deployCC \

-ccn crowdfund \

-ccp ../crowdfund-chaincode \

-ccl go

Docker output:

docker ps

3b0df68d42b2 hyperledger/fabric-peer:latest

Invoking and querying:

STEP 1 — Open CLI as Org1

Inside test-network:

export PATH=${PWD}/../bin:$PATH

export FABRIC_CFG_PATH=$PWD/../config/

Then load Org1 environment:

export CORE_PEER_TLS_ENABLED=true

export CORE_PEER_LOCALMSPID="Org1MSP"

export CORE_PEER_TLS_ROOTCERT_FILE=$PWD/organizations/peerOrganizations/org1.example.com/tlsca/tlsca.org1.example.com-cert.pem

export CORE_PEER_MSPCONFIGPATH=$PWD/organizations/peerOrganizations/org1.example.com/users/Admin@org1.example.com/msp

export CORE_PEER_ADDRESS=localhost:7051

Invoke command: invoked the function RegisterStartup from your crowdfund chaincode, which created a new startup asset with ID S1 on the ledger.

peer chaincode invoke -o localhost:7050 \

--ordererTLSHostnameOverride orderer.example.com \

--tls \

```
--cafile
$PWD/organizations/ordererOrganizations/example.com/tlsca/tlsca.example.com-cert.pem \

-C mychannel \

-n crowdfund \

--peerAddresses localhost:7051 \

--tlsRootCertFiles
$PWD/organizations/peerOrganizations/org1.example.com/tlsca/tlsca.org1.example.com-cert.pem \

--peerAddresses localhost:9051 \

--tlsRootCertFiles
$PWD/organizations/peerOrganizations/org2.example.com/tlsca/tlsca.org2.example.com-cert.pem \

--peerAddresses localhost:11051 \

--tlsRootCertFiles
$PWD/organizations/peerOrganizations/org3.example.com/tlsca/tlsca.org3.example.com-cert.pem \

--waitForEvent \

-c
'{"Args":["RegisterStartup","S1","TechCorp","tech@corp.com","PAN123","GST123","2020-01-01","IT","Private","India","MH","Mumbai","www.tech.com","AI Startup","2020","Riya"]}'
```

Query:

Then run GetStartup, which fetched and displayed the stored startup data for S1 from the ledger.

After successful invoke:

```
peer chaincode query \

-C mychannel \

-n crowdfund \

-c '{"Args":["GetStartup","S1"]}'
```

```
--tlsRootCertFiles $PWD/organizations/peerOrganizations/org2.example.com/tlsca/tlsca.org2.example.com-c
ert.pem \

2 channel

2-Channel Crowdfunding Network

Two channels were set up:
1. investment-channel — Org1 (Startup), Org2 (Investor), Org3 (Validator), Org4 (Platform)
2. gov-validation-channel — Org1 (Startup), Org3 (Validator), Org4 (Platform)

Chaincodes deployed:
- investmentcc on investment-channel (all 4 orgs must endorse)
- governancecc on gov-validation-channel (Org1, Org3, Org4 must endorse)

1. Investment Channel Setup

The investment channel was brought up using a bash script. It tears down any existing network then sets everything up from scratch.

Script

```
#!/bin/bash
# ================================================================
# COMPLETE 2-CHANNEL NETWORK SETUP
# Run this from: fabric-samples/test-network
#
# investment-channel     → Org1 + Org2 + Org3 + Org4
#
# ================================================================

set -e  # stop on any error

cd /mnt/c/Users/riyaf/Downloads/Blockchain1/fabric-samples/test-network

# ── Fix PATH first
──────────────────────────────────────────────────────────────────────
export PATH=$PWD/../bin:$PATH
export FABRIC_CFG_PATH=$PWD/../config/
```

```
echo "================================================================"
echo "  2-CHANNEL CROWDFUNDING NETWORK SETUP"
echo "================================================================"

```

Peers join channel — errors and fix

First attempt — wrong FABRIC_CFG_PATH (ERROR)

```
export FABRIC_CFG_PATH=$PWD/configtx   # <-- this was wrong

export CORE_PEER_LOCALMSPID=Org1MSP
export
CORE_PEER_TLS_ROOTCERT_FILE=$PWD/organizations/peerOrganizations/
org1.example.com/tlsca/tlsca.org1.example.com-cert.pem
export
CORE_PEER_MSPCONFIGPATH=$PWD/organizations/peerOrganizations/org1.
example.com/users/Admin@org1.example.com/msp
export CORE_PEER_ADDRESS=localhost:7051

peer channel join -b ./channel-artifacts/gov-validation-channel.block
2026-03-01 09:31:01.869 UTC 0001 ERRO [main] InitCmd -> Fatal error when
initializing core config : error when reading core config file: Config File "core"
Not Found in "[.../configtx]"
```

Fixed by setting FABRIC_CFG_PATH to the correct location:

```
export FABRIC_CFG_PATH=$PWD/../config/
```

Second attempt — context deadline exceeded (ERROR)

Even after fixing the config path, all three peers failed with connection timeout:

```
# Org1
export CORE_PEER_LOCALMSPID=Org1MSP
export CORE_PEER_ADDRESS=localhost:7051
peer channel join -b ./channel-artifacts/gov-validation-channel.block
Error: error getting endorser client for channel: endorser client failed to connect to
localhost:7051: failed to create new connection: context deadline exceeded

# Org3
export CORE_PEER_LOCALMSPID=Org3MSP
export CORE_PEER_ADDRESS=localhost:11051
peer channel join -b ./channel-artifacts/gov-validation-channel.block
Error: error getting endorser client for channel: endorser client failed to connect to
localhost:11051: failed to create new connection: context deadline exceeded

# Org4
export CORE_PEER_LOCALMSPID=Org4MSP
export CORE_PEER_ADDRESS=localhost:12051
peer channel join -b ./channel-artifacts/gov-validation-channel.block
Error: error getting endorser client for channel: endorser client failed to connect to
localhost:12051: failed to create new connection: context deadline exceeded
```

Checked if containers were even running:

```
docker ps | grep peer

17b4a0f09fb4   hyperledger/fabric-peer:latest   Up 18 minutes
0.0.0.0:12051->12051/tcp   peer0.org4.example.com
ccfe120fe5a3   hyperledger/fabric-peer:latest   Up 19 minutes
0.0.0.0:11051->11051/tcp   peer0.org3.example.com
1dd8e5f8ca00   hyperledger/fabric-peer:latest   Up 20 minutes
0.0.0.0:7051->7051/tcp     peer0.org1.example.com
9c6628690520   hyperledger/fabric-peer:latest   Up 20 minutes
0.0.0.0:9051->9051/tcp     peer0.org2.example.com
```

Containers were running fine. Tested peer channel list — failed without TLS, worked with TLS:

```
peer channel list
```

Error: error getting endorser client for channel: endorser client failed to connect to localhost:7051: failed to create new connection: context deadline exceeded

```
export CORE_PEER_TLS_ENABLED=true

peer channel list
2026-03-01 09:39:30.213 UTC 0001 INFO [channelCmd] InitCmdFactory ->
Endorser and orderer connections initialized
Channels peers has joined:
investment-channel
```

Note: *Root cause was CORE_PEER_TLS_ENABLED not being set. After exporting it, everything worked.*

All three peers join successfully

```
# Org1
export CORE_PEER_LOCALMSPID=Org1MSP
export CORE_PEER_ADDRESS=localhost:7051
peer channel join -b ./channel-artifacts/gov-validation-channel.block
2026-03-01 09:41:04.292 UTC 0001 INFO [channelCmd] InitCmdFactory ->
Endorser and orderer connections initialized
2026-03-01 09:41:04.817 UTC 0002 INFO [channelCmd] executeJoin ->
Successfully submitted proposal to join channel

# Org3
export CORE_PEER_LOCALMSPID=Org3MSP
export CORE_PEER_ADDRESS=localhost:11051
peer channel join -b ./channel-artifacts/gov-validation-channel.block
2026-03-01 09:41:18.821 UTC 0001 INFO [channelCmd] InitCmdFactory ->
Endorser and orderer connections initialized
2026-03-01 09:41:19.258 UTC 0002 INFO [channelCmd] executeJoin ->
Successfully submitted proposal to join channel

# Org4
export CORE_PEER_LOCALMSPID=Org4MSP
export CORE_PEER_ADDRESS=localhost:12051
peer channel join -b ./channel-artifacts/gov-validation-channel.block
```

2026-03-01 09:41:27.740 UTC 0001 INFO [channelCmd] InitCmdFactory -> Endorser and orderer connections initialized
2026-03-01 09:41:27.959 UTC 0002 INFO [channelCmd] executeJoin -> Successfully submitted proposal to join channel

Org2 is not a member of gov-validation-channel so it was not joined here. Its peer channel list only shows investment-channel

3. Governance Chaincode — gov-validation-channel

Approve for Org1, Org3, Org4

Note: the first set of approvals for Org1, Org3, Org4 were done before the collections config was finalized (around 10:21–10:28). These were later redone with the --collections-config flag.

```
# Org1
export CORE_PEER_LOCALMSPID=Org1MSP
export CORE_PEER_ADDRESS=localhost:7051

peer lifecycle chaincode approveformyorg \
  -o localhost:7050 --ordererTLSHostnameOverride orderer.example.com \
  --tls --cafile $ORDERER_CA \
  --channelID gov-validation-channel \
  --name governancecc --version 1.0 \
  --package-id
governancecc_1.0:dc4f395ed4fbe1fcb9ecbcbe5f2d7c76af9a7405d02d788fa9737a6
f12674f0d \
  --sequence 1 \
  --signature-policy "AND('Org1MSP.peer','Org3MSP.peer','Org4MSP.peer')"
2026-03-01 10:21:13.146 UTC 0001 INFO [chaincodeCmd] ClientWait -> txid
[a583e0cd...] committed with status (VALID) at localhost:7051

# Org3
export CORE_PEER_LOCALMSPID=Org3MSP
export CORE_PEER_ADDRESS=localhost:11051
# (same command)
2026-03-01 10:27:47.681 UTC 0001 INFO [chaincodeCmd] ClientWait -> txid
[640c700b...] committed with status (VALID) at localhost:11051
```

```
# Org4
export CORE_PEER_LOCALMSPID=Org4MSP
export CORE_PEER_ADDRESS=localhost:12051
# (same command)
2026-03-01 10:28:01.050 UTC 0001 INFO [chaincodeCmd] ClientWait -> txid
[6e54fdbc...] committed with status (VALID) at localhost:12051
```

Re-approve with collections config

```
# Org1
peer lifecycle chaincode approveformyorg \
  -o localhost:7050 --ordererTLSHostnameOverride orderer.example.com \
  --tls --cafile $ORDERER_CA \
  --channelID gov-validation-channel \
  --name governancecc --version 1.0 \
  --package-id
governancecc_1.0:dc4f395ed4fbe1fcb9ecbcbe5f2d7c76af9a7405d02d788fa9737a6
f12674f0d \
  --sequence 1 \
  --signature-policy "AND('Org1MSP.peer','Org3MSP.peer','Org4MSP.peer')" \
  --collections-config
/mnt/c/Users/riyaf/Downloads/Blockchain1/fabric-samples/gov-chaincode/collecti
ons_config.json
2026-03-01 10:54:19.327 UTC 0001 INFO [chaincodeCmd] ClientWait -> txid
[262bdbdc...] committed with status (VALID) at localhost:7051

# Org3
2026-03-01 10:54:50.551 UTC 0001 INFO [chaincodeCmd] ClientWait -> txid
[990faa3d...] committed with status (VALID) at localhost:11051

# Org4
2026-03-01 10:55:02.752 UTC 0001 INFO [chaincodeCmd] ClientWait -> txid
[2ba8631f...] committed with status (VALID) at localhost:12051
```

Check commit readiness

```
peer lifecycle chaincode checkcommitreadiness \
  --channelID gov-validation-channel \
  --name governancecc --version 1.0 --sequence 1 \
```

```
  --signature-policy "AND('Org1MSP.peer','Org3MSP.peer','Org4MSP.peer')" \
  --collections-config .../gov-chaincode/collections_config.json \
  --output json

{
      "approvals": {
            "Org1MSP": true,
            "Org2MSP": false,
            "Org3MSP": true,
            "Org4MSP": true
      }
}
```

Org2MSP is false because Org2 is not a member of this channel. This is fine — policy only needs Org1, Org3, Org4.

Commit governancecc

```
export CORE_PEER_LOCALMSPID=Org1MSP
export CORE_PEER_ADDRESS=localhost:7051

peer lifecycle chaincode commit \
  -o localhost:7050 --ordererTLSHostnameOverride orderer.example.com \

INV_PKG_ID=investmentcc_1.0:d7f639465536630566e3d3cabbb70655a38aec5eaff49dbbebe7e7480d8ebc0e

Fix collections_config.json

The file had placeholder MSP names that needed to be replaced with actual org IDs:

```
sed -i \
  -e 's/StartupOrgMSP/Org1MSP/g' \
  -e 's/InvestorOrgMSP/Org2MSP/g' \
  -e 's/ValidatorOrgMSP/Org3MSP/g' \
  -e 's/PlatformOrgMSP/Org4MSP/g' \
```

/mnt/c/Users/riyaf/Downloads/Blockchain1/fabric-samples/investment-chaincode/collections_config.json

Approve — first attempt (ERROR)

All 4 orgs approved using version 1.0 with collections config. But checkcommitreadiness without the --collections-config flag showed all false:

```
# All 4 orgs approved (version 1.0, sequence 1) — all returned VALID
# ...

peer lifecycle chaincode checkcommitreadiness \
  --channelID investment-channel \
  --name investmentcc --version 1.0 --sequence 1 \
  --signature-policy
"AND('Org1MSP.peer','Org2MSP.peer','Org3MSP.peer','Org4MSP.peer')" \
  --output json

{
	"approvals": {
		"Org1MSP": false,
		"Org2MSP": false,
		"Org3MSP": false,
		"Org4MSP": false
	}
}
```

Note: *The check was run without --collections-config so it didn't match the stored approval. Always include --collections-config in the check.*

Re-approve attempts — more errors

```
# Tried re-approving same version 1.0, sequence 1 — FAILED
peer lifecycle chaincode approveformyorg --name investmentcc --version 1.0

peer lifecycle chaincode querycommitted --channelID investment-channel

Committed chaincode definitions on channel 'investment-channel':
Name: investmentcc, Version: 1.1, Sequence: 1, Endorsement Plugin: escc, Validation Plugin: vscc

5. Final State

Both chaincodes are committed and running:

investment-channel:
Name: investmentcc, Version: 1.1, Sequence: 1

gov-validation-channel:
Name: governancecc, Version: 1.0, Sequence: 1

Errors encountered during setup:
1. FABRIC_CFG_PATH set to configtx instead of config/ — core.yaml not found
2. CORE_PEER_TLS_ENABLED not exported — context deadline exceeded on all peers
3. checkcommitreadiness run without --collections-config — showed all false
4. Tried to re-approve same version 1.0 — 'unchanged content' error
5. Tried sequence 2 — 'larger than next available sequence' error

All resolved. Network is up and both chaincodes are active.

 DUAL CHANNEL CONCURRENCY TEST SUITE
 Gov: gov-validation-channel | Inv: investment-channel
==========================================

==========================================
 SETUP — Preparing entities
==========================================
 Setup complete.

==========================================
 TEST 1 — CONCURRENT PROJECT CREATION (10 parallel)
==========================================
 Concurrent Results: 10/10 succeeded in 1093ms
 ✅ PASS — Concurrent project creation — 10/10 succeeded (≥80% threshold)

==========================================
 TEST 2 — CONCURRENT FUNDING (5 parallel investors)
==========================================
 Concurrent Funding Results: 5/5 succeeded in 1126ms
 ✅ PASS — Concurrent funding handled — 5/5 succeeded (MVCC conflicts expected)
 ℹ️  MVCC conflicts on same key are expected behaviour in Fabric

==========================================
 TEST 3 — CONCURRENT VALIDATION REQUESTS (5 parallel)
==========================================
 Concurrent Validation Results: 5/5 succeeded in 1090ms
 ✅ PASS — All concurrent validations succeeded — 5/5

==========================================
 ✅ PASS — Concurrent project creation — 10/10 succeeded (≥80% threshold)

==========================================
 TEST 2 — CONCURRENT FUNDING (5 parallel investors)
==========================================
 Concurrent Funding Results: 5/5 succeeded in 1126ms
 ✅ PASS — Concurrent funding handled — 5/5 succeeded (MVCC conflicts expected)
 ℹ️  MVCC conflicts on same key are expected behaviour in Fabric
```

```
==============================================
 TEST 3 — CONCURRENT VALIDATION REQUESTS (5 parallel)
==============================================
 Concurrent Validation Results: 5/5 succeeded in 1090ms
 ✅ PASS — All concurrent validations succeeded — 5/5

==============================================
 ℹ️  MVCC conflicts on same key are expected behaviour in Fabric

==============================================
 TEST 3 — CONCURRENT VALIDATION REQUESTS (5 parallel)
==============================================
 Concurrent Validation Results: 5/5 succeeded in 1090ms
 ✅ PASS — All concurrent validations succeeded — 5/5

==============================================
==============================================
 TEST 3 — CONCURRENT VALIDATION REQUESTS (5 parallel)
==============================================
 Concurrent Validation Results: 5/5 succeeded in 1090ms
 ✅ PASS — All concurrent validations succeeded — 5/5

==============================================
==============================================
 Concurrent Validation Results: 5/5 succeeded in 1090ms
 ✅ PASS — All concurrent validations succeeded — 5/5

==============================================
 ✅ PASS — All concurrent validations succeeded — 5/5

==============================================
 CONCURRENCY TEST SUMMARY

==============================================
 CONCURRENCY TEST SUMMARY
==============================================
 CONCURRENCY TEST SUMMARY
==============================================
==============================================
 Total Tests : 3
 Passed      : 3
 Failed      : 0
 Pass Rate   : 100.0%
==============================================

 ℹ️  Note: MVCC conflicts in concurrent writes to same key
 are EXPECTED in Hyperledger Fabric and not a bug.
 Fabric uses optimistic concurrency — last write wins.

Comparision

Performance (Single Channel)

I ran 20 transactions for each of the 8 workflow steps on the single channel. All 160 transactions completed successfully.

Test	Operation	Org	TPS	Avg Latency	Result
Test 1	Register Startup	Org1	0.48	2050ms	100%
Test 2	Validate Startup	Org3	0.57	1750ms	100%
Test 3	Register Investor	Org2	0.54	1850ms	100%
Test 4	Validate Investor	Org3	0.55	1800ms	100%
Test 5	Create Project	Org1	0.57	1750ms	100%
Test 6	Approve Project	Org3	0.58	1700ms	100%
Test 7	Fund Project	Org2	0.55	1800ms	100%
Test 8	Release Funds	Org4	0.57	1750ms	100%

TPS stayed around 0.55 and latency around 1800ms throughout — pretty consistent. The full end-to-end workflow from registering a startup all the way to releasing funds worked without a single failure.

Functional Tests

These tests check things like: does the system block duplicate registrations, does it reject investors with low income, does it correctly cancel a rejected project, etc.

Test	What I Tested	Single Channel	Dual Channel
1a	Block duplicate startup registration	PASS	PASS
1b	Block duplicate investor registration	PASS	PASS

2	Reject investor with income below Rs. 5 lakh	PASS	PASS
3a	Project rejection works	PASS	PASS
3b	Rejected project status shows as CANCELLED	PASS	FAIL
3c	Cannot approve an already rejected project	PASS	PASS
4	Block zero amount funding	PASS	PASS
5a	Refund on a cancelled project	FAIL	FAIL
5b	Block double refund	PASS	PASS
6a	Raise a dispute within the window	PASS	PASS
6b	Resolve dispute with refund decision	PASS	FAIL
6c	Block duplicate dispute	PASS	PASS
7a	Block unvalidated startup from creating project	PASS	PASS
7b	Block unvalidated investor from funding	PASS	PASS

	Single Channel	**Dual Channel**
Passed	13 / 14	11 / 14
Failed	1 / 14	3 / 14
Pass Rate	92.8%	78.5%

The single channel did better here. The dual channel had two extra failures because when a project gets rejected on the gov channel, that status update doesn't automatically reflect on the investment channel. Same issue happened with dispute resolution — a dispute raised on one channel couldn't be found when trying to resolve it from the other. These are sync bugs, not a design flaw, but they did affect the score.

The one failure both have in common (Test 5a — refund on cancelled project) is a chaincode bug I still need to fix.

Privacy Tests

Test	What I Tested	Single Channel	Dual Channel
1	InvestorOrg blocked from gov channel	N/A	PASS
2a	Investor Aadhar not visible in public state	FAIL	FAIL
2b	Startup PAN not visible to InvestorOrg	FAIL	FAIL
2c	Validator can read validation status	PASS	PASS
3	Gov channel data not leaking to investment channel	N/A	PASS
4a	Startup cannot see investor's annual income	FAIL	FAIL
4b	Validator sees correct investor status	PASS	PASS
5a	Fake approval hash is rejected	PASS	PASS
5b	Funding an unapproved project is blocked	PASS	PASS

	Single Channel	Dual Channel
Passed	8 / 11	8 / 11
Pass Rate	72.7%	72.7%

Both scored the same here. The three failures in both versions happen because I'm currently storing sensitive fields like Aadhar, PAN, and annual income directly in the public ledger state — which means anyone on that channel can read them. I need to move these to Fabric Private Data Collections (PDC) which keep that data off the main ledger and only share it with specific orgs.

Where dual channel does have a real advantage is that InvestorOrg is physically cut off from the gov channel at the network level — not by code, but by the network topology. In a single channel you'd have to handle that entirely through chaincode-level access control.

Security Tests

Test	What I Tested	Single Channel	Dual Channel
1	Investor tries to approve a project	PASS	PASS
2	Startup tries to validate itself	PASS	PASS
3	Fund a project that doesn't exist	PASS	PASS
4	Release funds before project is fully funded	PASS	PASS
5	Dispute window logic is enforced	PASS	PASS
6	Investor tries to access gov channel directly	N/A	PASS

Both passed 100%. Role-based access control is working correctly across both setups — no org can do something outside its assigned role.

Failure & Recovery

Test	What I Tested	Both Versions
1	Fund an already closed project	PASS
2	Release funds twice	PASS
3	Refund on an active project	PASS
4	Approve a project twice	PASS
5a	Query a startup that doesn't exist	PASS
5b	Query an investor that doesn't exist	PASS
5c	Query a project that doesn't exist	PASS
6	Resolve a dispute that was never raised	PASS
7	Create a project under a non-existent startup	PASS

9/9 in both. Error handling is solid.

Concurrency

Test	What I Tested	Result
1	10 parallel project creations	10/10 in 1093ms — PASS
2	5 investors funding the same project at once	5/5 in 1126ms — PASS
3	5 parallel validation requests	5/5 in 1090ms — PASS

Both versions handled concurrent transactions fine. MVCC conflicts (when two transactions try to write the same key at the same moment) are expected in Hyperledger Fabric and aren't treated as failures — the system handled everything correctly.

Overall Summary

Area	Single Channel	Dual Channel	Which is Better
End-to-end workflow	100% — 8/8	Not tested separately	Single Channel
Functional tests	92.8% — 13/14	78.5% — 11/14	Single Channel
Privacy tests	72.7% — 8/11	72.7% — 8/11	Tie
Security tests	100% — 6/6	100% — 6/6	Tie
Failure & recovery	100% — 9/9	100% — 9/9	Tie
Concurrency	100% — 3/3	100% — 3/3	Tie
Data isolation by design	No	Yes	Dual Channel
Complexity	Low	High	Single Channel
Cross-channel sync bugs	None	Present	Single Channel

Conclusion

Looking at the test results, the single channel is clearly more reliable right now. It had fewer failures, no sync issues, and every workflow step completed without problems. It's also much simpler to maintain since all logic lives in one chaincode on one channel.

That said, I think the dual channel is the better design for the long term. The whole point of splitting channels is to separate concerns — KYC and validation data shouldn't be on the same channel as investment activity, and the dual channel enforces that at the network level. The failures I saw there are fixable bugs, not architectural problems.
